

Feedback | Group 4

Milestone 1

Problem Definition | 20 points

The problem is clearly defined. However, the solution could be more specific.

- Broad Area of Interest
- Preliminary Research
 - Current trends
 - Opportunities
- Solution with Methodology
 - Data Collection: **how are you going to get the data**
 - Analytical Techniques **analytical techniques wasn't defined**
 - Implementation Plan
- Expected Outcomes: **the API is still unclear**
- Evaluation Metrics

Grade: 10/20

Roadmap | 10 points

Grade: 10/10

Administrative Tasks | 5 points

- Roles are assigned
- Preliminary discussion with me was done
- Slack channel is created
- Github Repo is created

Grade: 5

Technical Tasks | 5 points

- Proper **.gitignore** file is available
- The Requirements.txt file is available, indicating that **venv** was created
- The first chapter of the Package Development course is done by **everyone**

Grade: 5/5

Grade

Overall, you did a really great job during the M1. Keep it like that!

Final Grade: 30/40

Milestone 2 | Tasks

From the milestone 1:

- Clarify data collection
- Analytical technique (how are you going to deal with the images)
- How is the API going to look like?

Product and Project Manager | 40 points

1. Name your Python package: register to [pypi](#)
2. Install `mkdocs` package to start with the documentation
3. Database schema: Provide your product database structure (ERD)
4. Transform your project file structure according to the below tree

```
PythonPackageProject/ #github repo
├── yourpackagename/
│   ├── __init__.py
│   ├── submodule1/ #database related
│   │   ├── __init__.py
│   │   └── submodule1_1.py
│   ├── submodule2/ #model related
│   │   ├── __init__.py
│   │   └── submodule1_2.py
│   └── submodule3/ # api related
│       ├── __init__.py
│       └── submodule1_2.py
├── tests/
│   ├── __init__.py
│   ├── test_module1.py
│   └── test_module2.py
├── example.ipynb # showing how it works
├── run.py # in order to run an API
├── docs/ #this folder we need for documentation
├── .gitignore
├── requirments.txt
├── README.md
├── LICENSE
└── setup.py
```

Data Scientist and Data Analyst | 20 points

1. Simulate the data if you need
2. Try to use the CRUD functionality done by DB Developer
3. Work on modeling part using simple models

```
from yourpackage.submodule2 import modelname
```

Database Developer | 30 points

1. Create a DB and respective tables suggested by the Product Manager
2. Connect to SQL with Python
3. Push data from flat files to DB
4. Test the code provided [here](#) and complete the missing components
5. Add extra **methods** that you might need throughout the project:
 1. Communicate with PM and API Developer for custom functionality

```
from yourpackage.submodule1 import sqlinteractions
```

API Developer | 30 points

1. Communicate with DB Developer and PM in order to design the API
2. You can create dummy endpoints in the beginning, then communicate with PM as well
3. The following endpoints must be available:
 1. GET
 2. POST
 3. UPDATE

Check out this [this repo](#).

```
from yourpackage.submodule2 import api
```

Milestone 2 | Feedback

Tasks from Milestone 1

You have provided more

DataCamp

Done by everyone.

Product and Project Manager | 40 points

1. The package is not registered in Pypi or the link is not provided
2. **mkdocs** package is not in the requirements.txt
3. The schema is provided
4. **Partially done**: Once you have the package, you need to call it from your GitHub repo and insert the data into SQL from there. **creating_tables_and_filling_data.py** file must be out of the package. Like you did with the **run.py** Likewise, with other modules.

Grade: 20/40

Data Scientist and Data Analyst | 20 points

- The data was successfully simulated/ingested, however the location was wrong
- modeling module was initiated with **empty file**

Grade 10/20

Database Developer | 30 points

- DB and schema was successfully implemented
- Connection between SQL and Python is available
- Data is loaded
- Custom functions are available

Grade: 30/30

API Developer | 30 Points

- run.py is working
- Requests:
 - POST request is available
 - GET request is available
 - PUT(update) request is not available

Grade: 30/30 Good Job!

I would recommend also including the **logger module** in proper logging.

M2 Grade: 90/120

Milestone 3 | Tasks

Remaining tasks from M2

- fix init.py's
- fix the database module
- add modeling part

DataCamp

Complete the third chapter.

Product and Project Manager | 30 points

1. Design the final endpoints:
 - the outputs you need for modeling

- the outputs you need to analyze the study
2. Communicate the outputs with the team in order to help them create/modify final classes/methods, etc.
- design query functions according to your needs
 - design modeling components according to your needs
3. Create sample documentation using [mkdocs](#). Once you have the final version of a package, you'll update it. For now, push to GitHub the following:
- a selected template
 - index.md page1 and page2 with dummy content (though you are free to provide actual documentation as well)

Data Scientist and Data Analyst | 30 points

- Create a model based on the Product Manager's requirements
- Insert the outcome into the respective SQL folder. (communicate with the Product Manager and DB developer in case you need extra table and/or functionality)
- Data Analyst must try to interpret the model or create custom visualizations

Database Developer | 30 points

- Based on the new/updated requirements, provide functionality in order to interact with the DB
 - API developer might need customer functionality for the final endpoints
 - Data Scientist/Analyst developer

API Developer | 30 Points

- make your requests directly from the Database
- Note: you can make endpoints to test the data as well `get_something()`.
